DRC Technologies, Inc. Announces New Engineering Services Contract

Austin, Texas – November 15, 2008 – DRC Technologies, Inc. (DRC) has finalized an engineering services contract with a major U.S. cement manufacturing company. The contract calls for DRC to conduct an engineering study for purposes of feasibility, data collection, and scaling parameters for a new type of clinker reduction system leading to finished product. A variety of other materials will also be evaluated during the study for purposes of comparing the process reduction to that of other mill systems, and to gauge market and cross-functional applicability. A final report is scheduled for release in the first quarter of 2009.

“We are excited about the opportunity,” said Wendell Howard, CEO. “This contract provides DRC an opportunity to work with an excellent client, and to utilize our engineering capabilities to refine and optimize a new solids reduction technology for multiple applications that we’ve been working on for some time. ”

For additional information on DRC’s engineering services and solids reduction products, contact Fred Erickson at (512) 346-6106 or visit www.drctechinc.com.

DRC Technologies, Inc. is an Austin-based corporation providing both U.S. and international customers with complete design and implementation solutions to improve business processes and optimize business operations for increased profitability and growth.
